

RavenQt SIG Meeting Minutes for 2021-05-26:

=====

- 1) Discussion of current repo status
- 2) Discussion of remaining tests needed
- 3) Review of near-term plans
- 4) Other

=====

P2SH discussion

- there appears to be some difference between the error message given by raven-qt v4.3.2.1 and the error message given by v4.7PR#1019 when attempting to do a P2SH asset operation pre-BIP9-deployment
- it will happen only pre-BIP9
- we discussed changing the error message, but agreed not to do so
- the P2SH code patch in PR#1019 continues to look like it may be the final patch before P2SH merging

Signing of binaries:

- we need to begin preparing for signing binaries for the next "official" mainnet release
- HyperPeek reported that Tron informed that the Foundation cannot use the credentials used by Medici for previous release signings.
- this needs to be verified
- if true, then we need the Foundation asap to apply for new signing credentials for Windows and Apple Mac

Messaging:

- We discussed briefly the requests to implement messaging in the raven-qt GUI
- implementation is complicated by the fact that good messaging support would include anti-spam, history, etc
- .
- some of these messaging topics are discussed in the repo files "Ravencoin/roadmap/messaging/README.md" and "Ravencoin/roadmap/messaging-antispam/README.md"

Atomic Swap:

- We discussed briefly that since Electrum and raven-qt are about to become up-to-date with full asset support, it is worth beginning discussions for where an atomic swap application should be best supported: An RPC-based application which works with raven-qt, an add-on application which works with Electrum, integrated into Electrum, a web page, etc.
